

Data Products and Processing for Solar System Science

Solar System Processing Pipeline Elements

1. Ingest Minor Planet Center orbit database to obtain new discoveries & detections
2. Update Prompt Data Product catalogs with new discoveries & detections from MPCORB
3. Release Solar System Prompt Data Products
4. Precompute ephemerides of known objects for fast association during nightly observing
5. Issue real-time alerts of all detections of known (associated) & unknown moving & variable sources
6. Run HeliLinC3D for tracklet linkage (objects need three tracklets within 15 days and $\text{SNR} \geq 5$)
7. (Precovery forced PSF photometry; run monthly)
8. Submit discoveries and measurements of known objects to Minor Planet Center

Acronym Definitions: MPC = Minor Planet Center; SS = Solar System; DIA = difference image analysis; SNR = signal-to-noise ratio
